

Task 1 Report – Tableau Data Visualization

Objective: To analyse a JSON dataset using Tableau and create visualizations to identify patterns, trends, and insights for data-driven decision making.

Dataset: A structured JSON dataset was imported into Tableau for analysis and visualization.

Tools Used: Tableau Public, JSON Dataset

Methodology: Data was imported, cleaned, and structured in Tableau. Key variables were identified and visualizations such as bar charts, line charts, and pie charts were created. A dashboard was developed to combine insights.

Visualizations: Bar chart for category comparison based on values, and a combined dashboard for overview insights.

Key Insights: Certain categories showed significantly higher values compared to others. Distribution analysis helped identify dominant categories within the data and the dashboard provided a clear and interactive overview of all insights.

Conclusion: Tableau helped convert raw JSON data into meaningful visual insights, supporting better understanding of patterns and decision-making.
